ABSTRACT OF THE DISCLOSURE

A system 10 is provided for recovering the potential energy of a hydrogen gas fuel supply within a fuel cell 10 includes 14. The system powered vehicle conventional storage tank 16 which receives and stores hydrogen gas at a relatively high pressure, an expander 20, a motor/generator 76 compressor selectively generates electrical power and pressure regulators 22, 24, a valve 26, an electrical charge storage device or battery 28, a controller 30, vehicle sensors 32 and electrical switches or switching 10 selectively channels system The module pressurized hydrogen gas through expander 18 which lowers the pressure of the hydrogen gas, rotatably drives compressor 20 and generates electricity. Controller 30 the generated electricity to be selectively causes communicated to electrical accessories 72, and/or to battery 28 by use of switching module 34, based upon vehicle attribute data received from sensors 32. upon the attribute data, controller 30 may also signal valve 26 to bypass expander 18, and cause electrical power to be supplied to motor/generator 76 from battery 28 to drive compressor 20.
